2011

-

2015

2024

-

2025

2025

-

Present

Education

Adeleke University

Bachelor degree, Computer Science

- Cumulative GPA of 3.6
- Activities and societies: Computer Club, Music.
- Project: Campus network and security.

Ahmadu Bello University

Masters degree, Information Management

- Cumulative GPA of 3.8
- ASSESSMENT OF THE IMPACT OF E-GOVERNANCE IN MANAGEMENT OF PUBLIC SERVICES IN FEDERAL CAPITAL TERRITORY ADMINISTRATION (FCTA), ABUJA

Work Experience

Full-stack Developer

Tribesquare Inc.

- Designed and optimized scalable full-stack solutions using Laravel and React.
- Worked on NIPOST website redesign and implementation, improving site architecture and performance (<https://nipost.tps.paystack.studio>).
- Developed reusable components and API integrations, enhancing development speed and reliability.
- Maintained technical documentation and streamlined engineering workflows
- Collaborated on an internal AI evaluation tool using Python and Node.js, building scripts to generate and validate coding datasets for LLM testing, reducing manual review time by 40%.
- Implemented Docker-based reproducible development environments for the NIPOST project, incorporating Bash scripting for automation and advanced Git workflows (e.g., branching and conflict resolution) to ensure consistent deployments across teams.
- Utilized LLM coding tools like GitHub Copilot to debug and review JavaScript/TypeScript code in React components, identifying edge cases and improving QA through unit and integration tests.

Backend Web Developer Consultant

Sydani Technologies

- Lead backend developer for NEMSAS a National Emergency Medical Services & Ambulance System using python and PostgreSQL.
- Led backend development for Dial-a-Doc telehealth platform using Laravel and MySQL.
- Designed RESTful APIs and database schemas, improving scalability and performance.
- Built secure systems for healthcare data management and real-time user engagement.

2023

-

Present

2025

- Developed Python-based data pipelines for analyzing telemedicine datasets, creating evaluation scenarios to detect anomalies in patient scheduling data,
- Set up Docker containers and dev containers for the Dial-a-Doc backend, using Linux/Bash scripts to automate testing workflows, and applied advanced Git techniques (e.g., patches and diffs) for collaborative code reviews.
- Integrated CodeWhisperer (an LLM coding tool) to assist in debugging TypeScript/Node.js notification modules, conducting edge-case testing and producing structured annotations for healthcare data validation.

Full-stack Developer

Kite App NG

- Built robust dashboard features using Laravel and Filament PHP, improving admin efficiency by 30%
- Developed an intelligent notification module and integrated activity tracking for dynamic analytics.
- Enhanced system reliability via secure API tokenization and advanced user analytics widgets.
- Created Python scripts for automating analytics dataset generation and evaluation, integrating with the notification module to simulate LLM reasoning scenarios and identify potential failure modes.
- Configured Dockerized environments for dashboard testing, incorporating Bash automation and advanced Git practices (e.g., conflict resolution) to streamline QA processes and ensure reproducibility.
- Employed Cursor (an LLM coding tool) to accelerate JavaScript/TypeScript development in user analytics widgets, focusing on unit tests and debugging to boost system reliability by catching subtle issues early.

2021
2024

IT Support Engineer & Web Developer

AVO Health LTD

- Designed a billing receipt web app with integrated third-party payment solutions.
- Redeveloped organizational web platforms: avohealth.org, avologistics.org.ng, and uacfng.org.
- Implemented multi-login security systems and provided technical mentorship to colleagues.

2017
2020

IT Support Engineer

Abia State Government

- Supported revenue optimization systems and process automation initiatives.
- Contributed to digital transformation projects improving service efficiency.

Project Experience

AURAMED - Clinical Management System (<https://forahia.com/auramed>)

- Designed and developed AuraMed, a comprehensive clinical management system for alternative medicine clinics, digitizing patient records, appointments, billing, and specialized treatments (Acupuncture, Chiropractic, Iridology) with role-based access for medical staff.
- Built responsive React frontend with TypeScript/Tailwind CSS and engineered scalable Python FastAPI backend with SQLAlchemy ORM, JWT authentication, and MySQL database deployed on Hostinger shared hosting.
- Implemented intelligent features including real-time BMI calculation, prescription stock validation, automated billing calculations, and pharmacy inventory management with expiry tracking and low-stock alerts.

FORAFIX - Home Services Marketplace Platform (<https://forahia.com/forafix>)

- Built a two-sided on-demand marketplace connecting clients with vetted service providers (cleaning, repairs, delivery) across Abuja, Nigeria, featuring real-time GPS tracking, in-app escrow payments, and automated agent matching based on geolocation.
- Architected with React.js (web client), Flutter (mobile apps), Laravel (backend API), MySQL (spatial data for location tracking), Pusher (real-time chat & notifications), and integrated Payscale for secure payment processing and Google Maps API for reverse geocoding and route optimization.
- Implemented role-based authentication (Client/Provider), automated service area detection (e.g., "Kagini, Abuja Municipal"), escrow-based payment release system, masked communication to prevent platform bypass, and scalable infrastructure supporting expansion to multiple Nigerian cities.

ECOTRACK NG - Intelligent Waste Management & Recycling Platform (<https://forahia.com/ecotrack>)

- Developed EcoTrack NG, an AI-powered waste management platform that connects households, businesses, and recyclers to improve waste collection, recycling rates, and environmental sustainability in Nigeria.
- Built a full-stack solution featuring AI waste classification (Google Gemini), real-time tracking with route optimization, and a rewards system that converts waste into digital tokens for users.
- Developed using Laravel 12, React 18 + Inertia.js, Tailwind CSS, Pusher WebSockets, and MySQL, with PWA support for offline functionality.

FLOWSLOT - Smart Appointment Booking System (<https://forahia.com/flowslot>)

- Built a full-stack appointment scheduling platform enabling service businesses (salons, clinics, consultants) to eliminate double-bookings through automated slot locking, real-time availability, and instant email/SMS confirmations.
- Architected with Laravel 11, React 18, Inertia.js, and MySQL on shared hosting (Hostinger), implementing enterprise-grade features including idempotent booking API, transactional database safety with row-level locking, queued notifications, and Swagger/OpenAPI 3.0 documentation.
- Implemented DevOps pipeline using GitHub Actions for automated testing, building, and deployment with zero-downtime considerations, while optimizing for shared hosting constraints through strategic caching and resource management.
